

ABSTRACT

A method of constructing a water-resistant corner for a tent or other fabric structure, and the corner formed

5 therefrom. A protective panel may be laid over a flooring material sheet, and the sheet and the protective panel are

---

folded into a corner. The formed corner may then be turned

inside out, so that the protective panel is located on the

outside of the newly-formed corner. The protective panel

10 thereby covers the outermost corner of the flooring, and the

seam formed at that corner. An interior waterproof layer,

such as a waterproof sealing tape, may be attached on the

inside of the inverted corner to act as a further moisture

15 barrier.
